

(a) Decision accuracy against each criterion**(b) Validity coefficient against each criterion**

Mastery pace is partly a property of what the platform chose to serve. As the platform's routing comes to track ability — with the child unchanged — the standing score's apparent accuracy against mastery pace rises by +0.098 AUC, entirely spuriously. Against MAP conditional growth, which is administered outside the platform, it moves +0.000. This is why the external anchor is not redundant: without it there is no way to tell a good instrument from a well-routed cohort.
