

(a) Predicting mastery pace

(b) Predicting MAP conditional growth

(c) Executable now, no comparator needed

Against mastery pace the instrument reaches AUC 0.670 and the CogAT-like comparator 0.636. The paired difference is +0.034 [+0.020, +0.049] — an edge that survives the interval but is far smaller than the gap between either instrument and a useful one; adding CogAT to the instrument moves AUC to 0.672. Panels (a) and (b) are the design of a study that cannot yet be run. Panel (c) can be run as soon as the platform exports routing data, needs no comparator at all, and decides whether either of the others means anything.
